Common Mistakes and How to Avoid Them

- □ Common Mistakes in Evaluation
- □ Checklist for Avoiding Common Mistakes
- □ A Systematic Approach to Performance Evaluation
- □ Case Study: Remote Pipes vs RPC

Common Mistakes in Evaluation

- 1. No Goals
 - No general purpose model
 - ➢ Goals ⇒ Techniques, Metrics, Workload
 - Not trivial
- 2. Biased Goals
 - "To show that OUR system is better than THEIRS"
 - Analysts = Jury
- 3. Unsystematic Approach
- 4. Analysis Without Understanding the Problem
- 5. Incorrect Performance Metrics
- 6. Unrepresentative Workload
- 7. Wrong Evaluation Technique

©2010 Raj Jain www.rajjain.com

Common Mistakes (Cont)

- 8. Overlook Important Parameters
- 9. Ignore Significant Factors
- 10. Inappropriate Experimental Design
- 11. Inappropriate Level of Detail
- 12. No Analysis
- 13. Erroneous Analysis
- 14. No Sensitivity Analysis
- 15. Ignoring Errors in Input
- 16. Improper Treatment of Outliers
- 17. Assuming No Change in the Future
- 18. Ignoring Variability
- 19. Too Complex Analysis

Common Mistakes (Cont)

- 20. Improper Presentation of Results
- 21. Ignoring Social Aspects
- 22. Omitting Assumptions and Limitations

Checklist for Avoiding Common Mistakes

- 1. Is the system correctly defined and the goals clearly stated?
- 2. Are the goals stated in an unbiased manner?
- 3. Have all the steps of the analysis followed systematically?
- 4. Is the problem clearly understood before analyzing it?
- 5. Are the performance metrics relevant for this problem?
- 6. Is the workload correct for this problem?
- 7. Is the evaluation technique appropriate?
- 8. Is the list of parameters that affect performance complete?
- 9. Have all parameters that affect performance been chosen as factors to be varied?

Checklist (Cont)

- 10. Is the experimental design efficient in terms of time and results?
- 11. Is the level of detail proper?
- 12. Is the measured data presented with analysis and interpretation?
- 13. Is the analysis statistically correct?
- 14. Has the sensitivity analysis been done?
- 15. Would errors in the input cause an insignificant change in the results?
- 16. Have the outliers in the input or output been treated properly?
- 17. Have the future changes in the system and workload been modeled?
- 18. Has the variance of input been taken into account?

Checklist (Cont)

- 19. Has the variance of the results been analyzed?
- 20. Is the analysis easy to explain?
- 21. Is the presentation style suitable for its audience?
- 22. Have the results been presented graphically as much as possible?
- 23. Are the assumptions and limitations of the analysis clearly documented?

A Systematic Approach to Performance Evaluation

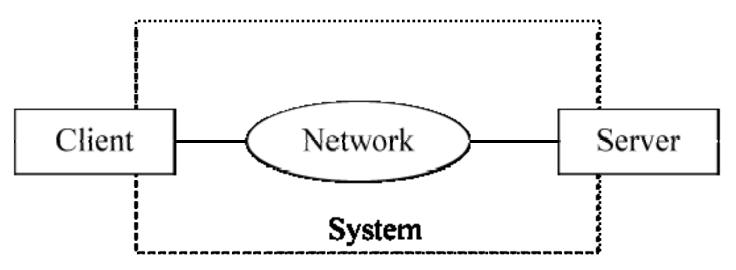

- 1. State Goals and Define the System
- 2. List Services and Outcomes
- 3. Select Metrics
- 4. List Parameters
- 5. Select Factors to Study
- 6. Select Evaluation Technique
- 7. Select Workload
- 8. Design Experiments
- 9. Analyze and Interpret Data
- 10. Present Results

Repeat

Case Study: Remote Pipes vs RPC

□ System Definition:

□ Services: Small data transfer or large data transfer.

□ Metrics:

- □ No errors and failures. Correct operation only.
- □ Rate, Time, Resource per service.
- □ Resource = Client, Server, Network

This leads to:

- > Elapsed time per call.
- > Maximum call rate per unit of time, or equivalently, the time required to complete a block of *n* successive calls.
- > Local CPU time per call.
- > Remote CPU time per call.
- > Number of bytes sent on the link per call.

□ System Parameters:

- > Speed of the local CPU.
- > Speed of the remote CPU.
- > Speed of the network.
- > Operating system overhead for interfacing with the channels.
- > Operating system overhead for interfacing with the networks.
- > Reliability of the network affecting the number of retransmissions required.

□ Workload parameters:

- > Time between successive calls.
- > Number and sizes of the call parameters.
- > Number and sizes of the results.
- > Type of channel.
- > Other loads on the local and remote CPUs.
- > Other loads on the network.

Factors:

- > Type of channel: Remote pipes and remote procedure calls
- > Size of the Network: Short distance and long distance
- > Sizes of the call parameters: small and large.
- > Number *n* of consecutive calls=Block size: 1, 2, 4, 8, 16, 32, ..., 512, and 1024.

Note:

- > Fixed: type of CPUs and operating systems.
- > Ignore retransmissions due to network errors
- > Measure under no other load on the hosts and the network.

■ Evaluation Technique:

- ➤ Prototypes implemented ⇒ Measurements.
- > Use analytical modeling for validation.

□ Workload:

- > Synthetic program generating the specified types of channel requests.
- > Null channel requests
 - ⇒ Resources used in monitoring and logging.

□ Experimental Design:

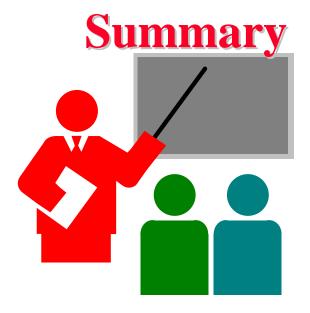

A full factorial experimental design with $2^3 \times 11 = 88$ experiments will be used.

□ Data Analysis:

- > Analysis of Variance (ANOVA) for the first three factors
- \triangleright Regression for number n of successive calls.

□ Data Presentation:

> The final results will be plotted as a function of the block size *n*.

- ☐ The analysis technique, metrics, workloads depend upon the goal of the study
- Metrics are based on services provided by the system
- System and workload parameters determine the right set of experiments
- Correct analysis and presentation of results is important

Exercise 2.1

□ From published literature, select an article or a report that presents results of a performance evaluation study. Make a list of good and bad points of the study. What would you do different, if you were asked to repeat the study?

Exercise 2.2

Choose a system for performance study. Briefly describe the system and list:

- a. Services
- b. Performance metrics
- c. System parameters
- d. Workload parameters
- e. Factors and their ranges
- f. Evaluation technique
- g. Workload

Justify your choices.

■ Suggestion: Each student should select a different system such as a network, database, processor, and so on.

Homework 1

- □ Read chapters 2
- □ Submit answers to
 - > Exercise 2.2 assuming the system is a personal computer
 - > The solution should be limited to 3 pages.

Common Mistakes in Homework 1

- □ Not defining the system
- ☐ List of metrics not based on services
- Mixing system and workload parameters

Project Homework 1

- Search web pages, books, and journal articles from ACM Digital Library, Applied Science, Compendex, ABI/INFORM Complete, and Knovel databases at Olin Library for one of the following topics:
 - > Computer Systems Performance Analysis
 - > Computer Systems Modeling
 - > Computer Systems Simulation
 - > Experimental Design
 - > Queueing Theory
- □ On the web try the following search points:
 - http://scholar.google.com
 - http://books.google.com
 - http://a9.com/

Project Homework 1 (Cont)

- http://citeseer.ist.psu.edu/
- http://www.scirus.com/srsapp/
- http://searchnetworking.techtarget.com/bestWebLinks/
- > See also http://www.searchengineguide.com/pages/Science/
- □ Ignore all entries dated 2003 or before. List others in the following format (up to 5 each):
 - > Author, "Title," publisher, year. (for 5 books)
 - > "Title," URL [One line description] (for 5 web pages)
 - > Author, "Title," source (for 5 technical/magazine articles)
 - > Title, publisher, URL (for 5 journals/magazines/periodicals)
- Make a list of other interesting search points and share with the class.

Common Mistakes in Project Homework #1

- □ Listing older books
- □ Listing books/Magazines/journals that have little to do with the topic may show up in search engines because of a minor mention of the topic or words
- Web Pages No one line descriptions
